

Activator & Thinner Selection Guide – NATIONAL RULE

NOTE: Activator selection affects curing speed of the product, while thinner selection affects delivery and application of the product to the repair area. It may be desired to use a faster activator with a slower thinner in single panel or smaller applications. Avoid using the opposite extremes of activators and thinners such as ICA-799™ with ICR-1692™, or ICA-803™ with ICR-1695™.

* Can be used in conjunction with thinner of choice. COM RT2 not to exceed 10%.
